

epay Integration Module (IM) - universal cash register API

ECR integration made easy

The payment area is changing. The integration of terminals into the ECR is becoming increasingly complex due to different protocols, APIs specifications, constantly growing requirements, market conditions and different hardware components.

Therefore, epay has developed the **epay Integration Module (IM)** to connect payment terminals easily to the ECR. The epay IM functions as a **universal cash register interface** which allows for a smooth integration of all common payment terminals without having to integrate each of them individually. The epay IM is **available as standard programming library**, as **client (Windows DLL, Linux Cardware)** for the ECR, and as **web**.

Benefits of the epay IM

- ✓ **Plug & Play integration** of POS terminal
- ✓ IM **saves integration time** and **reduces costs**
- ✓ Comprehensive **API documentation**
- ✓ **Simple starter kit** for smooth integration
- ✓ **All common POS terminals** and **card payment functions** are supported
- ✓ **Value-added services** such as **mobile top-up, gift cards** and **APM** (e.g. Alipay, WeChat Pay, Huawei Pay) are possible
- ✓ Enables these **value-added services** even if **terminal does not support them** or **if there is no terminal at all**
- ✓ **Future-proof:** continuous maintenance and support of the interface
